In the Claims

The following amendments are made with respect to the claims in the International application PCT/GB2005/000121.

This listing of claims will replace all prior versions and listings of claims in this application.

- 1 (original). An ink formulation comprising a marking component and a metal salt that absorbs laser irradiation at 700-2000 mn and thereby causes the marking component to change colour.
- 2 (currently amended). [[A]]<u>The</u> formulation according to claim 1, wherein the metal is a transition metal.
- 3 (currently amended). [[A]]<u>The</u> formulation according to claim 2, wherein the metal is copper.
- 4 (currently amended). [[A]]<u>The</u> formulation according to <u>any preceding claim_1</u>, wherein the salt is a poly-metal salt.
- 5 (currently amended). [[A]]<u>The</u> formulation according to <u>any preceding claim_1</u>, which additionally comprises a compound including an oxymetal anion.
- 6 (currently amended). [[A]]<u>The</u> formulation according to <u>any preceding claim_1</u>, which additionally comprises a colour-forming compound.
- 7 (currently amended). [[A]]<u>The</u> formulation according to <u>any preceding claim 1</u>, which additionally comprises a binder.
- 8 (currently amended. [[A]]<u>The</u> formulation according to any preceding claim_1, which is water-based.
- 9 (currently amended). [[A]]<u>The</u> formulation according to any preceding claims claim 1, which comprises an organic solvent.

- 10 (currently amended). A method for forming an image on a substrate, which comprises applying onto the substrate a formulation according to any preceding claim, and irradiating it an ink formulation comprising a marking component and a metal salt that absorbs laser irradiation at 700-2000 mn and thereby causes the marking component to change colour, wherein said method further comprises irradiating the formulation with a laser.
- 11 (currently amended). [[A]]<u>The</u> method according to claim 10, wherein the laser is a diode or CO₂ laser.
- 12 (new). An ink formulation comprising a marking component and a metal salt, wherein the marking component in the absence of the metal salt undergoes a colour change in response to laser irradiation at a wavelength above 2000 nm but not between 700-2000 nm, and the metal salt absorbs laser radiation at 700-2000 nm thereby causing the marking component to change colour.
- 13 (new). The formulation according to claim 12, wherein the metal is a transition metal.
 - 14 (new). The formulation according to claim 13, wherein the metal is copper.
- 15 (new). The formulation according to claim 12, wherein the salt is a poly-metal salt.
- 16 (new). The formulation according to claim 12, wherein the salt is copper hydroxyl phosphate.
- 17 (new). The formulation according to claim 12, which additionally comprises a compound including an oxymetal anion.
- 18 (new). The formulation according to claim 12, which additionally comprises a colour-forming compound.

- 19 (new). The formulation according to claim 12, which additionally comprises a binder.
 - 20 (new). The formulation according to claim 12, which is water-based.
- 21 (new). The formulation according to claim 12, which comprises an organic solvent.
- 22 (new). A method for forming an image on a substrate, which comprises applying onto the substrate an ink formulation comprising a marking component and a metal salt, wherein the marking component in the absence of the metal salt undergoes a colour change in response to laser irradiation at a wavelength above 2000 nm but not between 700-2000 nm, and the metal salt absorbs laser radiation at 700-2000 nm thereby causing the marking component to change colour wherein said method further comprises irradiating the formulation with a laser.
- 23 (currently amended). [[A]]<u>The</u> method according to claim 22, wherein the laser is a diode or CO₂ laser.
